NEW: **Speedy** and **Rondo**
partly available in aluminum

100% Swiss made 

Main Catalogue

Carry ball screws
Carry **Speedline** high-helix ball screws
Speedy high-helix lead screws
Rondo round thread lead screws

The choice is yours

Thread rolling is the core expertise of Eichenberger Gewinde AG. Not surprisingly, the Company utilizes this process to form the thread profiles of all the screws it makes. Thread rolling (often also referred to as thread milling) is the cold forming of the surface of round workpieces. The thread form is produced by causing a radial dynamic force to be exerted between the two rotating rolling dies that form the workpiece. As the roll die profile penetrates the workpiece surface, the material in cold state is pressed all the way down into the root diameter of the thread roll die and is therefore rolled according to nominal value.

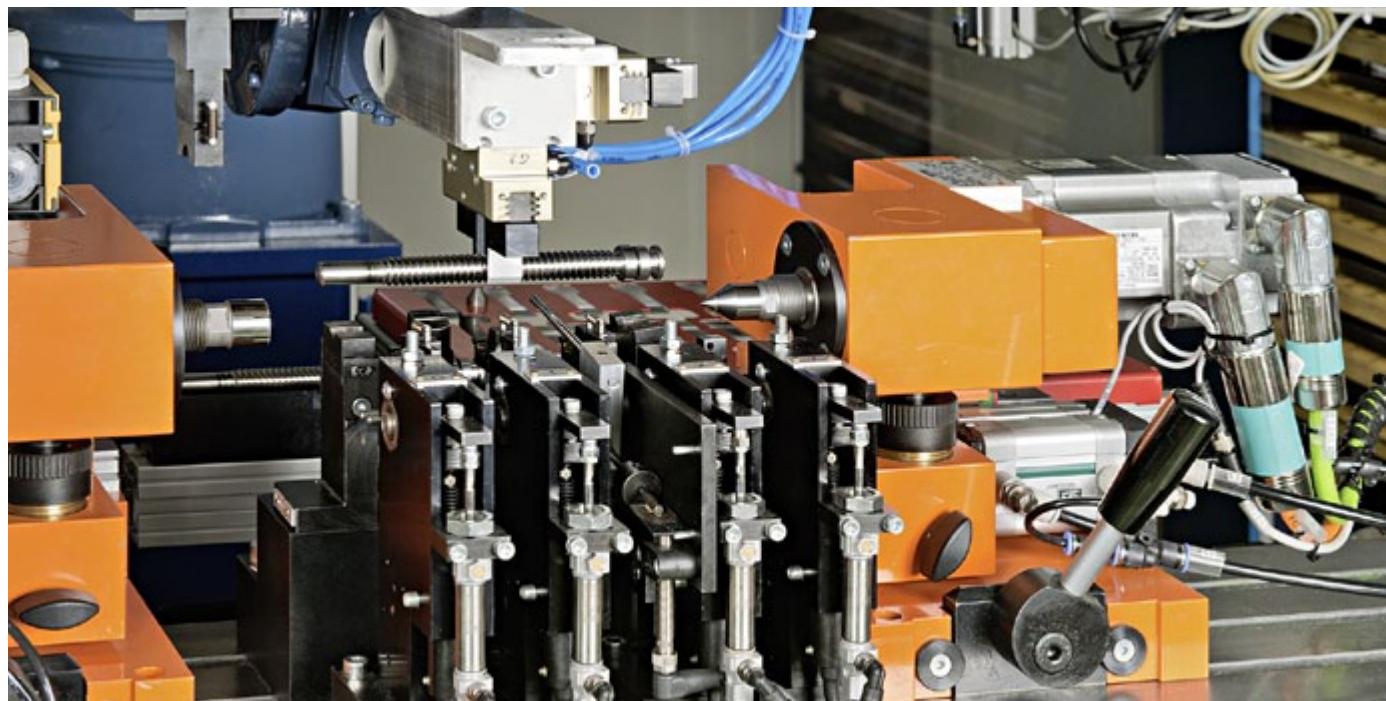

Advantages of thread rolling:

- significant increase in hardness through cold forming
- excellent surface smoothness on thread flanks and in ground radius
- reduced notch sensitivity
- no interrupted swalfe as in machine-ground threads
- excellent dimensional accuracy
- rational manufacturing process
- extremely cost-effective especially in large production batches

Even though all Eichenberger lead screws are made using the rational thread rolling process, individual model series feature distinct differences in design and performance. Product characteristics therefore need to be considered when selecting the right product.

Basic differences are shown in the summary description (opposite).

Summary description

Carry ball screws

Due to their premium quality and precision, the rolled Carry ball screws are suitable for all linear applications where heavy loads need to be transferred with optimum efficiency.

- \varnothing 4–40 mm
- p 1–40 mm
- for high loads at medium moving speeds

pages 4/5 and 6–41

Carry Speed-line high-helix ball screws

The cold-rolled, wear-resistant Carry Speed-line are marked by an extremely high helix. They provide for high moving speeds and deliver an efficiency which is nothing short of impressive.

- \varnothing 8–25 mm
- p 10–50 mm
- for medium loads at high moving speeds

pages 4/5 and 42–51

Speedy high-helix lead screws

The Speedy high-helix lead screws with helix up to 6 x diameter provide for maximum moving speeds at low rotational speeds or efficient conversion of linear to rotary movements.

- \varnothing 4–36 mm
- p 4–200 mm
- for low loads at high moving speeds
- slide screw unit
(steel, aluminium on request)

pages 52/53 and 54–77

Rondo round thread lead screws

The alternative to trapezoidal screws with remarkable efficiency.

- \varnothing 6–16 mm
- p 2–5 mm
- for medium loads at medium moving speeds
- slide screw unit
(steel, aluminium on request)

pages 52/53 and 78–84

Order system Carry

Example for complete ball screw _____	KGT 16x5 FGR RH 1 S 350 G7 A E M
Type of lead screw _____	
KGT = Carry ball screw	
Nominal size (d₀ x p) [mm] _____	
Type of nut _____	for nut only
ZYI = cylindrical single nut with single-thread ball return	
ZYR = cylindrical single nut with tube type ball return	
FGI = nut with mounting thread and single-thread ball return	
FGR = nut with mounting thread and tube type ball return	
FBI = flange nut with single-thread ball return	
FBR = flange nut with tube type ball return	
MSX = special design according to drawing	
Right-hand / left-hand thread _____	
RH = right-hand thread (standard)	
LH = left-hand thread (→ see dimensional charts)	
Number of ball circulations _____	for nut only
1 = 1 ball circulation	
2 = 2 ball circulations	
3 = 3 ball circulations	
4 = 4 ball circulations	
Wiper (Seal) _____	for nut only
S = with wipers (plastic or brushes)	
N = without wipers	
Ball screw overall length [mm] _____	for screw only
Lead accuracy (class) _____	for screw only
G9 = ≤ 0.1 mm/300 mm (standard)	
G7 = ≤ 0.052 mm/300 mm (on special request)	
G5 = ≤ 0.023 mm/300 mm (on special request)	
Backlash _____	for nut only
A = standard backlash (see dimensional charts)	
R = reduced backlash upon specification	
Screw end machining _____	for screw only
O = no end machining (cut by grinding, hardened ends; nut on mounting tube)	
E = end machining according to drawing	
Assembly _____	
G = screw and nut separate	
M = screw and nut assembled according to drawing/specified orientation	
Example for screw only _____	KGT 16x5 RH 350 G7 O G
Example for nut only _____	KGT 16x5 FGR RH 1 S A G

Carry ball screws

Carry type «ZYI»

Cylindrical single nut with single-thread ball return

Legend

d_0 = nominal screw diameter [mm]
 d_1 = outside screw diameter [mm]
 d_2 = core diameter [mm]
 p = pitch [mm]
 i = number of ball circulations [-]
 D_w = ball diameter [mm]
 S = lubrication hole (position not defined) [mm]
SA = wipers

K = plastic

B = brushes

F = felt rings (on request; in case of lifetime lubrication)

T = standard backlash [mm]

³⁾ = only on request

Warning! Note when selecting a ball screw that the maximum rotational speed depends on the system's rotational speed characteristics.
See page 39 for the appropriate calculations.

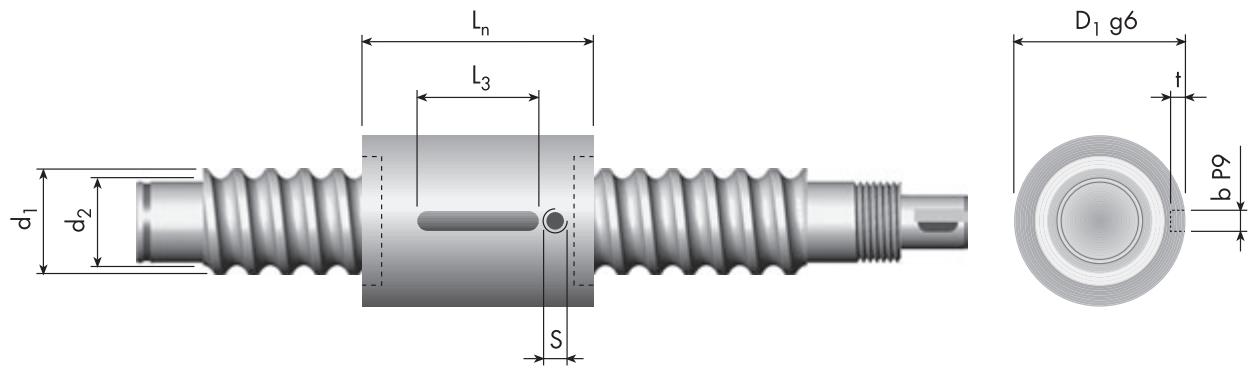

Special designs available on request.

Carry ball screws

Basic design / Materials

Basic design

Carry screws are manufactured by the highly economical cold-rolling process which offers both significant cost savings but also maintains a precision previously often only available with machine-ground screws. Carry screws are complemented by a range of single steel nuts produced in a special cost-cutting process.

Carry offers all the advantages of the inherent ball screw design:

- high efficiency, i.e.
 - low power input
 - low self-heating
- low frictional, stick-slip-free running
- maximum wear resistance, i.e. very good repetition accuracy with a constant positioning precision.
- high reliability and durability.

Materials

- standard: steel
100Cr6 (1.3505)
and
Cf53 (1.1213)
- on request:
X46Cr13 (1.4034)
- other materials on request

Attention: The use of stainless steel results in lower load rates; details on request.

Nut designs

Standard are the following three types:

Cylindrical single nut type «ZY...»

Nut with mounting thread type «FG...»

Flange nut type «FB...»

Thread profile

Used most commonly are gothic arc (ogival) profiles.

Carry ball screws

Ball return / Precision / Lubrication

Ball return

Nuts feature single-thread ball returns or tube type ball returns, both fully integrated into the nut shape.

Single-thread ball return, type «...l»

Tube type ball return, type «...R»

Operating temperatures

Regular applications: -20 to +80 °C.

Please ask about other operating temperatures.

Lead accuracy

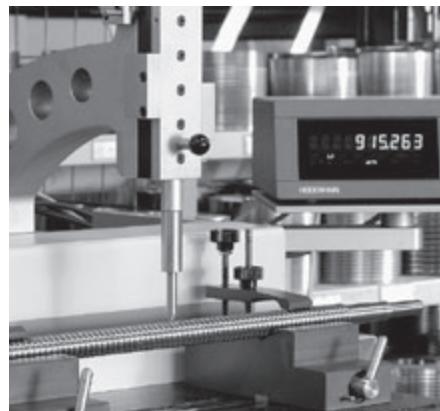

Eichenberger ball screws feature the following lead accuracies according to DIN 69051:

Standard:

- G9 $\Delta \leq 0.1$ mm/300 mm

On request:

- G7 $\Delta \leq 0.052$ mm/300 mm
- G5 $\Delta \leq 0.023$ mm/300 mm

Reduced backlash

If necessary, reduced backlash up to ≤ 0.01 mm is available (only with paired or assembled screws).

Efficiency

The efficiency η for Carry ball screws is better than 0.9.

Wipers

Plastic (K) or brush (B) wipers are used, depending on nut type/dimension. Felt rings (F) available on request (in case of lifetime lubrication).

Lubrication

The usual specifications for lubricating ball bearings also apply to ball screws. However, lubrication applied only once but intended to last a lifetime is not sufficient in most cases. Regular lubrication is required to extend the service life of the ball screw.

Please note:

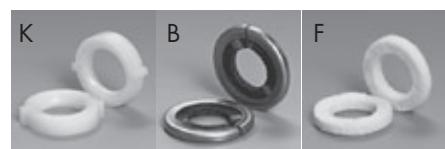

When shipped, screws simply have a protective film. Before mounting or operating the ball screw, units must be lubricated with the proper lubricant (through the lube hole for nuts with wipers; directly onto the screw for nuts without wipers).

Recommended all-purpose lubricant:

- Klüber Microlube GBU Y 131

When using another lubricant, please verify compatibility with anticorrosion agent; otherwise rinse ball screw unit prior to lubrication.

Caution: Do not use grease containing graphite or MoS₂.

Carry ball screws

Factory length / Ball screw ends / Handling

Factory length

In general, Eichenberger screws are available as threaded rods, approx. 2.8 to 3 m long. Upon request, lengths up to 6 m are available, depending on diameter and supply market situation.

Ball screw ends

Ball screw ends are without any machining cut by grinding (standard).

Upon request, a so-called standard screw end journal with three turned bearing seats (see figure below) is available. Dimensions are as per customer specifications.

Screws may also be ordered with softened ends for subsequent finishing by the customer or with an application-specific end journal.

In each instance, a detailed drawing would be necessary.

Note also the links to the CAD data at www.gewinde.ch

Handling

Ball screws are precision parts and must be protected from shock, dirt or moisture when transported or stored. Please do not unpack until ready for use.

Please check for cleanliness when mounting the ball screw. Dirt or foreign matter on the ball race – especially inside the nut – may cause increased wear and premature failure.

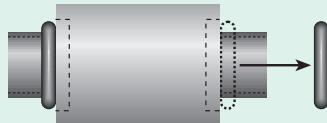

Please consult lubrication recommendation on page 33 before mounting or operating ball screws.

Radial loads and torque

Radial loads or torque brought to bear upon the nut result in overload of individual contact surfaces, thus seriously affecting the service life of the ball screw assembly. Therefore it is important to properly mount the screw and to comply with all relevant form and positional tolerances.

Assembling

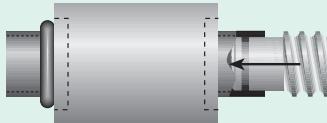

1.

Remove transport lock (O-ring) on one side. Please keep sleeve and nut in horizontal position. Otherwise, the nut may slide from the sleeve and balls may fall out of the ball race.

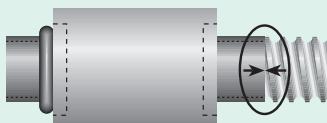

In the event such incident does occur, balls must be properly re-inserted to prevent damage to or blockage of the ball screw. If in doubt, please contact Eichenberger Gewinde AG.

2.

Insert screw end into mounting sleeve.

!

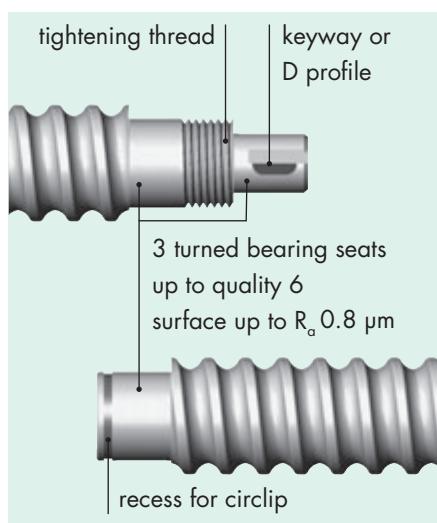

Caution: Operator must be able to advance sleeve up to the thread intake. Otherwise, balls may fall out of the ball race and damage or block the unit.

3.

Gently turn nut onto the screw.

Carry ball screws

Design fundamentals

The following are the relevant calculations which underly screw design and safe operation.

For detailed information on ball screw design, please refer to DIN 69051.

«Suitability test» rotational speed characteristics

When selecting a ball screw it is important to first ensure that the correct nut design for the ball return system required to support the maximum rotational speed demanded by the application is used (independet of the screw length).

The maximum rotational speed is based on the system's rotational speed characteristics and the outside screw diameter:

$$n_{\max} = \frac{\text{rotational speed characteristic}}{d_1} [\min^{-1}]$$

n_{\max} = maximum rotational speed [\min^{-1}]

- Rotational speed characteristics [–] for
- single-thread ball return: 60 000 (Carry «...l» types)
 - tube type ball return: 80 000 (Carry «...R» types)
 - end cap ball return: 80 000 (Carry Speedline «...E» types)

d_1 = outside screw diameter [mm]

Calculations at dynamic load:

Critical rotational speed n_{\perp}

Permissible rotational speeds must differ substantially from the screw's own frequency.

$$n_{\perp} = K_D \cdot 10^6 \cdot \frac{d_2}{l_a^2} \cdot S_n [\min^{-1}]$$

n_{\perp} = permissible rotational speed [\min^{-1}]

K_D = characteristic constant as a function of bearing configuration [–]
→ see below

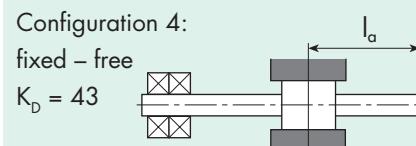

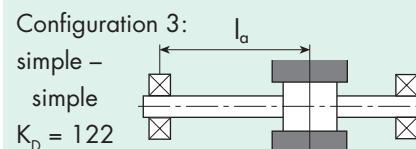

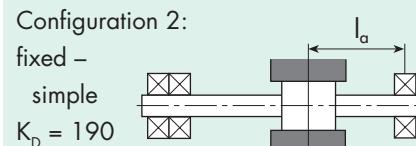

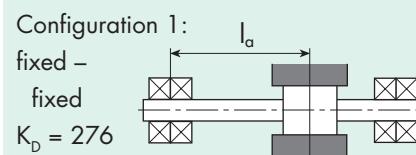

d_2 = core diameter [mm]

l_a = bearing distances [mm]

→ see below
(always include maximum allowable l_a in calculation)

S_n = safety factor

usually $S_n = 0.5 \dots 0.8$ [–]

Nominal service life L_{10} or L_h

$$L_{10} = \left(\frac{C_{\text{dyn}}}{F_m} \right)^3 \cdot 10^6 [\text{R}]$$

$$L_h = \frac{L_{10}}{n_m \cdot 60} [\text{h}]$$

L_{10} = service life in revolutions [R]

L_h = service life in hours [h]

C_{dyn} = dynamic load [N]

F_m = average axial load [N]

$F_{1\dots n}$ = load per cycle unit [N]

n_m = average rotational speed [\min^{-1}]

$n_{1\dots n}$ = rotational speed per cycle unit [\min^{-1}]

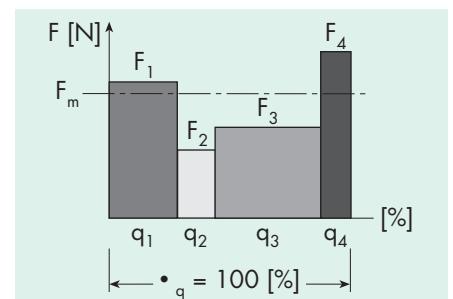

$q_{1\dots n}$ = cycles [%]

$100 = \sum_q (sum of cycles q_{1\dots n})$ [%]

Average axial load F_m

at constant rotational speed n_{const} and dynamic load C_{dyn}

$$F_m = \sqrt[3]{F_1^3 \frac{q_1}{100} + F_2^3 \frac{q_2}{100} + F_3^3 \frac{q_3}{100} + \dots} [\text{N}]$$

$$\rightarrow L_{10} = \left(\frac{C_{\text{dyn}}}{F_m} \right)^3 \cdot 10^6 [\text{R}]$$

$$\rightarrow L_h = \frac{L_{10}}{n_{\text{const}} \cdot 60} [\text{h}]$$

Carry ball screws

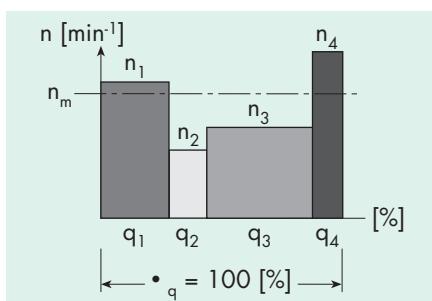

Design fundamentals

Calculations at dynamic load (continuation):

Average rotational speed n_m

at constant load F_{const}
and variable rotational speeds $n_{1 \dots n}$

$$n_m = n_1 \frac{q_1}{100} + n_2 \frac{q_2}{100} + n_3 \frac{q_3}{100} + \dots [\text{min}^{-1}]$$

$$\rightarrow L_{10} = \left(\frac{C_{\text{dyn}}}{F_{\text{const}}} \right)^3 \cdot 10^6 [\text{R}]$$

$$\rightarrow L_h = \frac{L_{10}}{n_m \cdot 60} [\text{h}]$$

Average axial load F_m

at constant rotational speeds n_{const}
and dynamic load C_{dyn}

$$F_m = \sqrt[3]{F_1^3 \frac{q_1}{100} + F_2^3 \frac{q_2}{100} + F_3^3 \frac{q_3}{100} + \dots} [\text{N}]$$

$$n_m = n_1 \frac{q_1}{100} + n_2 \frac{q_2}{100} + n_3 \frac{q_3}{100} + \dots [\text{min}^{-1}]$$

$$\rightarrow L_{10} = \left(\frac{C_{\text{dyn}}}{F_m} \right)^3 \cdot 10^6 [\text{R}]$$

$$\rightarrow L_h = \frac{L_{10}}{n_m \cdot 60} [\text{h}]$$

Efficiency η (theoretical)

Depends upon the type of power transmission.

Case 1: torque → linear movement

$$\eta \approx \frac{\tan \alpha}{\tan (\alpha + \rho)} [-]$$

Case 2: axial force → torque

$$\eta' \approx \frac{\tan (\alpha - \rho)}{\tan \alpha} [-]$$

whereby

$$\tan \alpha \approx \frac{p}{d_0 \cdot \pi} [-]$$

η = efficiency [%]

η' = corrected efficiency [%]

p = pitch [mm]

d_0 = nominal screw diameter [mm]

ρ = angle of friction [°]

$$\rightarrow \rho = 0.30 \dots 0.60^\circ$$

Efficiency η_p (practical)

The efficiency η for Carry ball screws is better than 0.9.

Driving torque M

Depends upon the type of power transmission.

Case 1: torque → linear movement

$$M_a = \frac{F_a \cdot p}{2000 \cdot \pi \cdot \eta} [\text{Nm}]$$

Case 2: axial force → torque

$$M_e = \frac{F_a \cdot p \cdot \eta'}{2000 \cdot \pi} [\text{Nm}]$$

M_a = input torque [Nm], case 1

M_e = output torque [Nm], case 2

F_a = axial force [N]

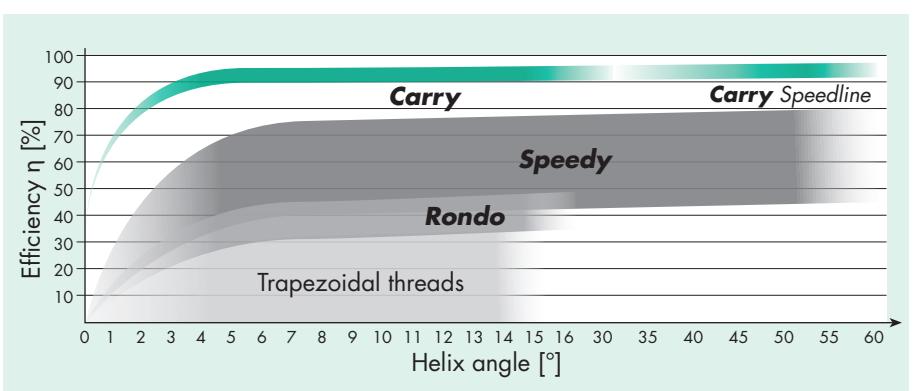

Input performance P

$$P = \frac{M_a \cdot n}{9550} [\text{kW}]$$

P = input performance [kW]

n = rotational speed [min^{-1}]

A safety margin of 20% is recommended when selecting drives.

Carry ball screws

Design fundamentals

Calculations at static load:

Permissible maximum load $F_{\text{per.}}$

$$F_{\text{per.}} = \frac{C_{\text{stat}}}{f_s} \text{ [N]}$$

C_{stat} = static load [N]

f_s = operating coefficient

→ normal operation: 1...2 [-]

→ shock load: 2...3 [-]

Permissible buckling force F_B

$$F_B = \frac{K_B}{S_B} \cdot \frac{d_2^4}{l_F^2} \cdot 10^3 \text{ [N]}$$

K_B = characteristic constant of load

(depends on design) [-]

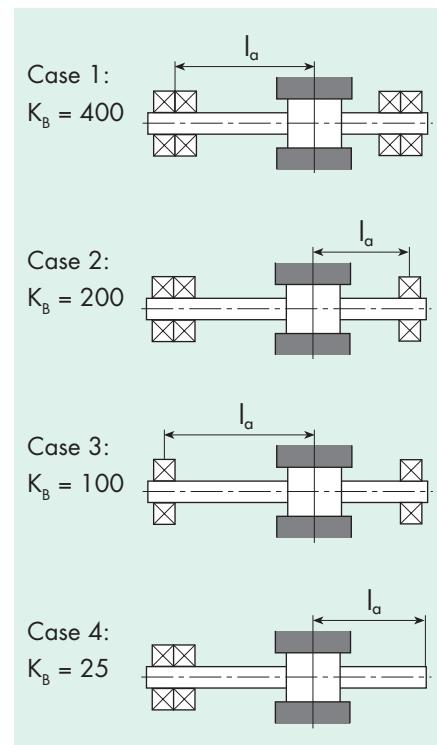

→ see below

d_2 = nominal screw diameter [mm]

l_F = force-transferring length [mm]

S_B = buckling safety factor

→ gen. $S_B = 2...4$ [-]

Carry Speedline high-helix ball screws

Carry Speedline type «FBE»

Flange nut with end cap ball return (following DIN 69051: flange type B nut, master gauge 3))

Legend

d_0 = nominal screw diameter [mm]
 d_1 = outside screw diameter [mm]
 d_2 = core diameter [mm]
 p = pitch [mm]
 i = number of ball circulations [-]
 D_w = ball diameter [mm]
 S = lubrication hole [mm]
SA = wipers
K = plastic
T = standard backlash

Warning! Note when selecting a ball screw that the maximum rotational speed depends on the system's rotational speed characteristics.
See page 39 for the appropriate calculations.

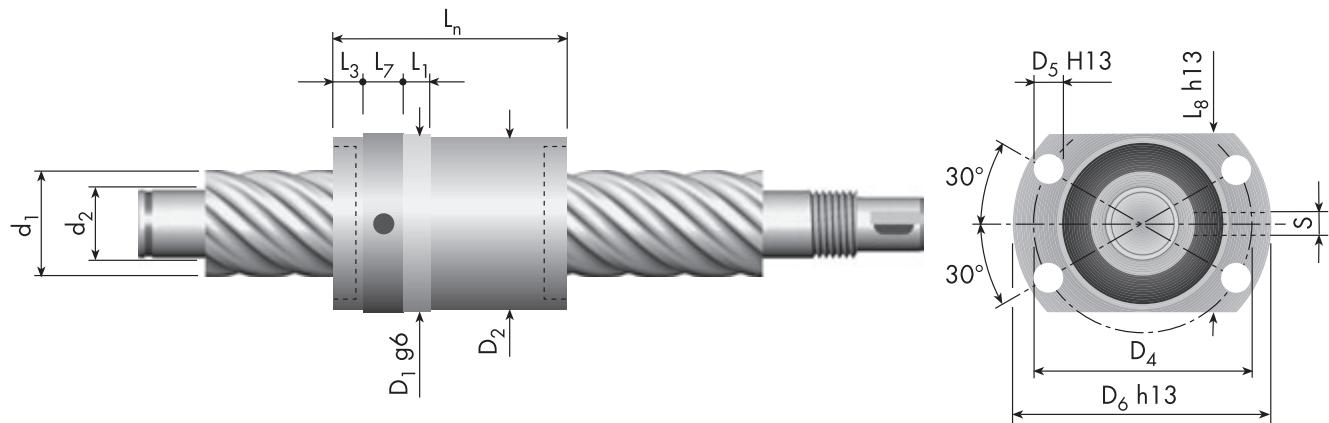

Special designs available on request.

All specifications are subject to change without notice.

Quality management ISO 9001:2008

Carry Speedline high-helix ball screws

Basic design / Materials

Basic design

Cold-rolled Carry *Speedline* ball screws feature an extremely high pitch. Designed to meet customer demand for a wear-free high-helix ball screw, they deliver a high transmission speed and an impressive efficiency.

Ball screws of the Carry *Speedline* are the product of the very economical cold-rolling process. They combine with single steel nuts produced in a unique specially developed process.

The design and production of this high-helix ball screws derives from our experience in making the Carry and Speedy screws. In other words, the Carry *Speedline* integrates the know-how of both technologies.

Carry *Speedline* offers all the advantages of the inherent ball screw design:

- high efficiency, i.e.
 - low power input
 - low self-heating
- low frictional, stick-slip-free running
- maximum wear resistance, i.e. very good repetition accuracy with a constant positioning precision.
- high reliability and durability.

Nut design

Standard are the following two types:

Cylindrical nut type «ZYE»

Flange nut type «FBE»

Thread profile

A gothic arc (ogival) profile is used.

Materials

- standard: steel 100Cr6 (1.3505)
- on request:
 - stainless steel X46Cr13 (1.4034)
- other materials on request

Attention: The use of stainless steel results in lower load rates; details on request.

Carry *Speedline* high-helix ball screws

Ball return / Precision

Ball return

Nuts feature end cap ball returns, fully integrated into the nut shape and serving as wipers.

These nut end caps with integrated ball returns and wipers are made of plastic.

End cap ball return type «...E»

Operating temperatures

Regular applications: -20 to +80 °C.

Please ask about other operating temperatures.

Lead accuracy

Eichenberger high-helix ball screws feature the following lead accuracies according to DIN 69051:

Standard:

– G9 ≤ 0.1 mm/300 mm

On request:

up to max. 1200 mm screw length

– G7 ≤ 0.052 mm/300 mm

– G5 ≤ 0.023 mm/300 mm

Lubrication

See Carry page 37.

Factory length

Ball screw ends

Handling

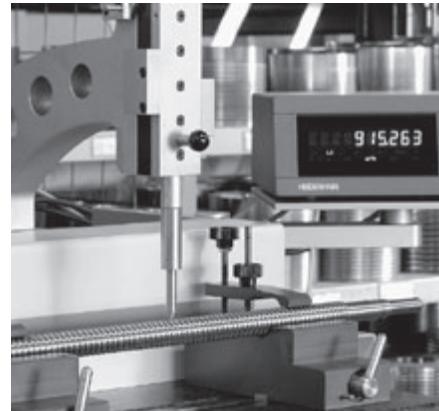

Radial loads and torque

Assembling

See Carry page 38.

Design fundamentals

See Carry pages 39–41.

Reduced backlash

Reduced backlash up to ≤ 0.01 mm is available (only with paired or assembled screws).

Efficiency

The efficiency η for this Carry Speedline is an impressive 0.95.

Wipers

Depending on construction Carry Speedline features integrated wipers as part of the plastic end caps.

Speedy high-helix lead screws

Basic design / Materials / Precision

Basic design

The Eichenberger high-helix lead screws are not called Speedy for nothing: never before have such high moving speeds been obtained at such low rotational speeds. The Eichenberger Speedy has made this possible by using a helix pitch unheard of before. High-helix lead screws are made of stainless steel and are formed by the cold-rolling process. They are coupled with high wear-resistant thermoplastic nuts in simple (standard, POM-C) or preloaded (POM-C or EX 100) designs. For higher loads or special applications, alternative plastic materials or bronze may be used for the nuts.

Materials

Screw

- standard: stainless steel X20Cr13 (1.4021)
- on request: other steel qualities, i.e. X2CrNiMo17-12-2 (1.4404)
or
X10CrNiS18-09 (1.4305)
- aluminium on request

Nut

- non-preloaded: POM-C black
- preloaded:
 - axial-preloaded: POM-C black
 - torsion-preloaded: EX100 white
(if $p_0 \geq d_0$)
- on request: iglidur® J *
- bronze CuSn12 (2.1052)
- other materials on request

Nut design

For all thread types a standard flange nut design has been defined, which is deliverable in the following types:

Flange nut, non-preloaded
 – type «SFM»: POM-C black
 – type «SBM»: bronze

Flange nut axial-preloaded
 – type «SFV»: POM-C black
 – type «SBV»: bronze (on request)

Flange nut torsion-preloaded (for square pitches and larger)
 – type «SFT»: EX100 white
 – type «SBT»: bronze (on request)

Of course, any other application-specific nut designs can be supplied on request including injection-molded solutions.

Temperature range

– POM-C / EX100	–40 to +60 °C
– iglidur® J	–50 to +90 °C
– bronze	–40 to +200 °C

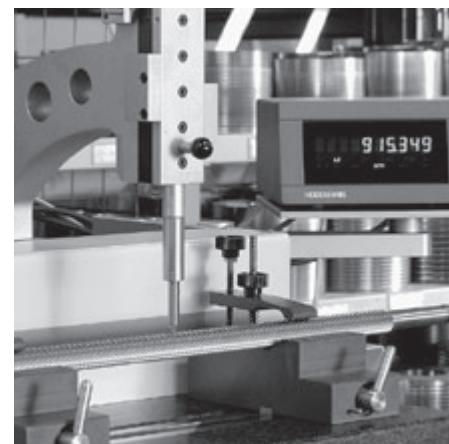

Lead accuracy

Standard:

- G9 $\Delta \leq 0.1$ mm/300 mm
(according to DIN 69051)

On request:

- other lead accuracies

Duty cycle

Load rates, lubrication notice and basic calculation with load factor f_L are based on a duty cycle of 10% for a Speedy with non-preloaded POM-C nut.

Efficiency

The efficiency η depends on the helix angle and reaches values from ~0.5 to 0.75 (see chart on page 76).

* iglidur® is a registered trademark of igus® GmbH

Speedy high-helix lead screws

Factory length / Handling / Lubrication

Factory length

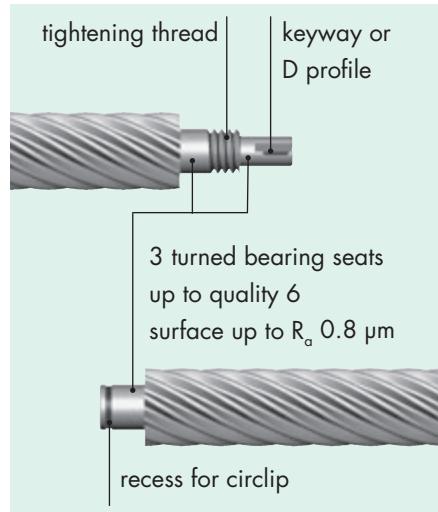

In general, Eichenberger screws are available as threaded rods, approx. 3 m long. Upon request, lengths up to 6 m are available, depending on diameter and supply market situation.

Lead screw ends

Speedy lead screws are cut to the desired length without special machining (standard).

Upon request, a so-called standard screw end journal with three turned bearing seats (see figure below) is available. Dimensions are as per customer specifications.

Note also the links to the CAD data at www.gewinde.ch

Handling

High-helix lead screws are precision parts (non-hardened) and must be protected from shock, dirt or moisture when transported or stored. Please do not unpack until ready for use.

Please check for cleanness when mounting the lead screw unit. Dirt or foreign matter on the thread may cause excessive wear.

Please consult lubrication recommendation before mounting or operating Speedy lead screws.

Radial loads and torque

Radial loads or torque brought to bear upon the nut result in overload of individual contact surfaces, thus seriously affecting the service life of the lead screw assembly. Therefore it is important to properly mount the screw and to comply with all relevant form and positional tolerances.

Lubrication

In some cases, a single lubrication with grease or oil is sufficient. However, any lubrication cycle depends on the application environment.

Bronze nuts have to be lubricated regularly.

Lubricant used by manufacturer:

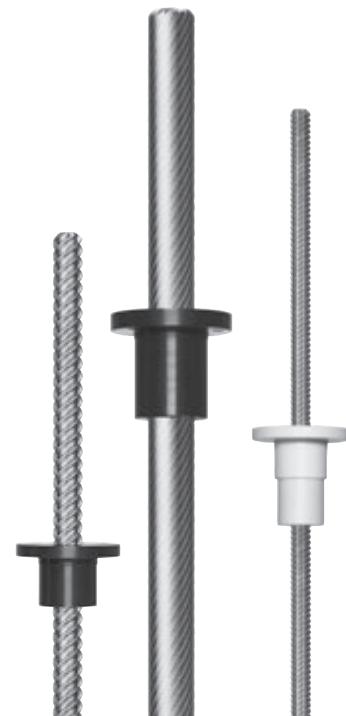

– Klüber Microlube GBU Y 131.

Applications

The Eichenberger high-helix lead screws are suitable for a variety of applications. For short strokes, they are a substitute for drive belts due to their low production cost. In addition, they are perfectly suitable as substitutes for hydraulic and pneumatic cylinders. Indeed, they allow low-friction acceleration as well as free positioning and operate without secondary energy sources. When appropriate, they are also ideal alternatives to trapezoidal or ball screws due to high efficiency and a convincing cost-performance ratio.

Typical applications are:

- Drives for doors, gates and windows
- Handling systems
- Graphics machinery
- Drives for valves and dampers
- Climate control systems
- Medical devices
- Textile machines
- Food and packaging industries
- Steering actuators
- Electronics industry
- etc.

Speedy high-helix lead screws

Design fundamentals

The following are the relevant calculations which underly high-helix screw design and safe operation.

Calculations at dynamic load:

Critical rotational speed n_{per}

Permissible rotational speeds must differ substantially from the screw's own frequency.

$$n_{\text{per}} = K_D \cdot 10^6 \cdot \frac{d_2}{l_a^2} \cdot S_n \text{ [min}^{-1}\text{]}$$

n_{per} = permissible rotational speed [min⁻¹]

K_D = characteristic constant as a function of bearing configuration

→ see below

d_2 = core diameter [mm]

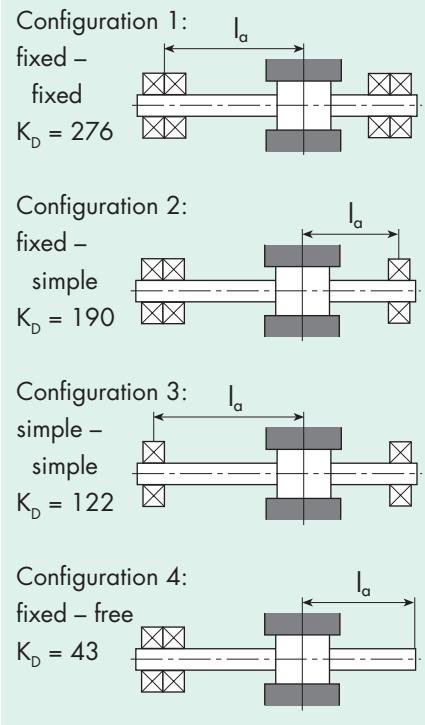

l_a = bearing distances [mm]

→ see opposite

(always include maximum allowable l_a in calculation)

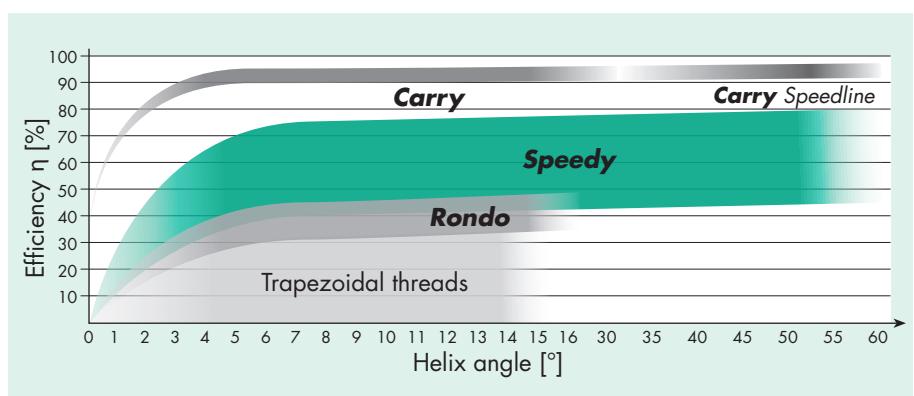

S_n = safety factor

usually $S_n = 0.5 \dots 0.8$ [-]

Efficiency η_p (practical)

The efficiency η depends on the helix angle and reaches values from ~0.5 to 0.75.

Speedy high-helix lead screws

Driving torque M

Depends upon the type of power transmission.

Case 1: torque → linear movement

$$M_a = \frac{F_a \cdot p}{2000 \cdot \pi \cdot \eta} \text{ [Nm]}$$

Case 2: axial force → torque

$$M_e = \frac{F_a \cdot p \cdot \eta'}{2000 \cdot \pi} \text{ [Nm]}$$

M_a = input torque [Nm]

M_e = output torque [Nm]

F_a = axial force [N]

η = efficiency [%]

η' = corrected efficiency [%]

p = pitch [mm]

Input performance P

$$P = \frac{M_a \cdot n}{9550} \text{ [kW]}$$

P = input performance [kW]

n = rotational speed [min^{-1}]

A safety margin of 20% is recommended when selecting drives.

Basic calculations

Maximum authorized load depending on speed

$$F_{\text{per.}} = C_0 \cdot f_L \text{ [N]}$$

C_0 = static load rate [N]

f_L = load factor [-] for POM-C nuts

circumferential speed v_C [m/min]	load factor f_L [-]
5	0.95
10	0.75
20	0.45
30	0.37
40	0.12
50	0.08

Example

Parameters:

Speedy 10/50 with non-preloaded POM-C nut, $d_0 = 10$ mm, $p = 50$ mm and $C_0 = 1250$ N; required moving speed $v_s = 200$ mm/sec.

We need to find: $F_{\text{per.}}$

We calculate n [min^{-1}],

$$n = \frac{v_s \text{ [mm/sec]} \cdot 60}{p \text{ [mm]}}$$

$$= \frac{200 \cdot 60}{50} = 240 \text{ min}^{-1}$$

circumferential speed v_C [m/min]

$$v_C = \frac{d_0 \text{ [mm]} \cdot \pi \cdot n \text{ [min}^{-1}\text{]}}{1000}$$

$$= \frac{10 \cdot \pi \cdot 240}{1000} = 7.53 \text{ m/min}$$

and find load factor f_L in above table:

f_L at v_C of 7.53 m/min ≈ 0.85 [-]

It follows:

$$F_{\text{per.}} = C_0 \cdot f_L = 1250 \cdot 0.85 = 1062.5 \text{ N}$$

In other words, the maximum load for a Speedy 10/50 at $v_s = 200$ mm/sec. ($\rightarrow n = 240 \text{ min}^{-1}$) is 1060 N.

Rondo round thread lead screws

- Order system Rondo 79

Rondo round thread lead screws

Basic design / Materials / Precision

Basic design

Rondo screws are a true alternative to conventional trapezoidal screws. They deliver outstanding efficiency and quiet running due to their round thread profile.

Made of steel, the lead screws are combined with plastic flange nuts (outer dimensions equal those of standard Speedy flange nuts).

Materials

Screw

- standard: stainless steel X20Cr13 (1.4021)
- on request: aluminium
- other materials on request

Nut

- standard: EX100 white
- on request: iglidur® J *
- other materials on request

Temperature range

- EX100 -40 to +60 °C
- iglidur® J -50 to +90 °C

Nut design

One standard nut design has been defined:

Flange nut type «RFM»

Of course, any other application-specific nut designs can be supplied on request including injection-molded solutions.

Lead accuracy

Standard:

- G9 $\Delta \leq 0.1$ mm/300 mm
(according to DIN 69051)

On request:

- other lead accuracies

Duty cycle

Load rates, lubrication notice and basic calculation with load factor f_L are based on a duty cycle of 10% for a Rondo made of standard materials.

Factory length / Handling / Lubrication

See Speedy page 75.

Design fundamentals

See Speedy pages 76/77.

Rondo round thread lead screws

Contract work

As our name suggests, thread rolling is the core business of Eichenberger Gewinde AG. Not only do the buyers of standard products benefit from our expert know-how but also those manufacturers who require economical cold rolled threads for their mechanical parts and components.

State-of-the-art production methods, extensive product expertise and access to more than 1000 machine tools, enable us to meet each and every demand for rolled threads – however exotic they may be:

- pitches up to 6 x diameter
- spindle length up to 6 m
- spindle diameter from 2 to 160 mm
- high-helix thread profiles
- ball screw thread profiles
- all standard profiles
(M, Tr, UNC, UNF, UNEF, Whitworth)
- multiple start threads including left-hand/right-hand threads
- special profiles
- worm gears
(quality and price advantages)
- serrations and knurlings

Quality Management ISO 9001:2008

What materials are suitable?

- all metals that feature an extension of at least 6% and do not exceed a tensile strength of 1300 N/mm²
- high-alloy, corrosion and acid-resistant steel
- special aluminium alloys
- riveting-quality brass
- copper alloys
- threads can be rolled on hollow bodies and tubes only if wall thickness is sufficient; this wall thickness depends upon the type and depth of intended profile as well as material used.
Please call or write for assistance.

What materials are not suitable?

- extremely brittle material such as Ms58, cast iron, etc.
- extremely soft materials such as lead
- synthetics
- wood.

We look forward to your challenge!

Thread rolling

Contract work

The examples below illustrate the range of available cold-rolling applications. We may even inspire you to investigate innovative solutions. Indeed, we are convinced that rational cold-rolling solutions are available to solve your particular threading problem. Why not consider the benefits of cold rolling and profit from our know-how?

Trapezoidal thread
as per ground profile DIN 103
Flat trapezoidal thread as per DIN 380
Multiple trapezoidal thread,
incl. left/right

Ball screw profile
As a rule, ogival threaded profiles
are used

Special threads with special profiles
according to customer specifications

High-helix profiles
– multiple threads with pitch up to
6 x diameter
– synthetic or brass nuts

Worm-gear profiles
as per basic profile DIN 3976
Single or multiple gears may be rolled

Milled edges as per DIN 82
– concentric
– left/right

Serrations as per DIN 5481

Threads on awkward parts

Conical threads

Thread rolling

About the company

Ever since the company was founded in 1953, the name Eichenberger Gewinde AG has been synonymous with premium-quality threads. A leading supplier of innovative linear power transmission products and a complete line of cold rolled threads, Eichenberger offers its customers unique products and comprehensive know-how.

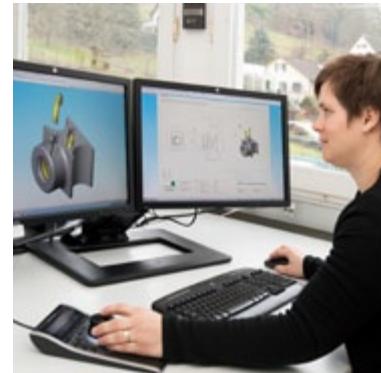

History

- 1953 Founding of a precision turning shop by Hans Eichenberger (sole proprietorship)
- 1976 Re-registering of the company as Eichenberger AG Tools and Machine Works
- 1986 Name change to Eichenberger Gewinde AG
- 1988 Development started on proprietary ball screws
- 1995 Replacement of individual fabrication by industrial production
- 1996 Kurt Husistein assumes leadership of the company
- 1998 Management buy out of Eichenberger Gewinde AG (APT Holding)
- 2004 Foundation of Eichenberger Motion AG (Automotive subsidiary)
- 2006 Openning of the production extension
- 2012 Office building ready to move in
- 2013 60th anniversary

Development, Manufacturing and QM

«Quality first»: As an ISO 9001:2008 certified company we leave nothing to chance – from development and manufacturing to distribution.

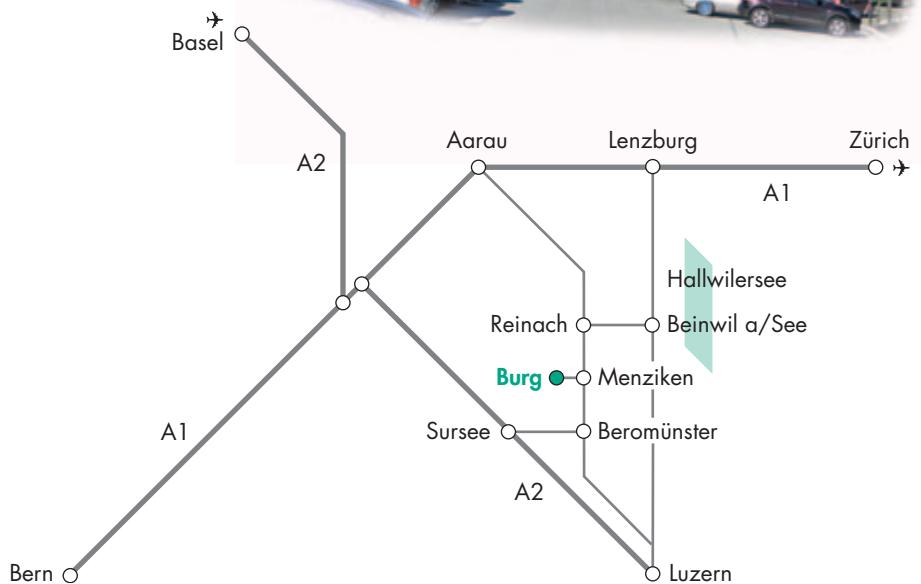

Efficient processes, modern production tools and qualified personnel with a sense of responsibility guarantee a standard of quality which has made us the preferred partner for many renowned companies around the world.
